## DETAILED ACTION

This Office Action is in response to the filing of the application.

### ***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 20-31 are rejected under 35 U.S.C. 103(a) as being unpatentable over Yoshida et al. (U.S. Patent 6,111,305) in view of Bendernagel et al. (U.S. Patent 5,061,652).

Yoshida discloses a p-i-n semiconductor photodetector (Figs. 9 and 10) that contains a plurality of cores (4), a light sensing sidewalls (6) along the exterior of the core that comprises four vertical sidewalls and a logic circuitry (transistor) above the core that blocks light from the core, the sidewalls are perpendicular to a surface of the photodiode and comprise a junction region that cause electron transfer. Yoshida discloses all of the limitations except for different conductivity types for core and sidewalls and a trench. In regards to claims 25 and 31 referring to the conductivity of the core and sidewalls, the conductivity of the core and the sidewalls can be either P or N but are different from each other but will not change the function of the device. Therefore it would have been obvious to one having ordinary skill in the art at the time

Art Unit: 2822

the invention was made to modify the Yoshida reference by interchanging the conductivity types of the core and sidewalls, since change in conductivity will not change the function of the device. In regards to the trench Bendernagel discloses a semiconductor device (Fig. 4) a pin photodiode (34) that has trenches (42A) filled with transparent material. The trenches are formed as isolation regions to isolate the photodiodes from each other. (Column 4, lines 21-37) Therefore it would have been obvious to one of ordinary skill in the art at the time the invention was made to modify the photodetector of Yoshida by incorporating trenches to isolate the photodiodes from each other as taught by Bendernagel.
